

# *Lecture 01282019*

AND

$X_1$	$X_2$	$Y$
0	0	0
0	1	0
1	0	0
1	1	1

Bit

7

PBT

MS

LS

8

10

Bit

$0 \sim 1023$

PB1 PB0

Bit wise logic

MSB: 7

LSB: 0

8 bit ?  $2^8 = 256$

10 bit ?  $2^{10} = 1024$

analog digital converter

$0 \sim 5V$

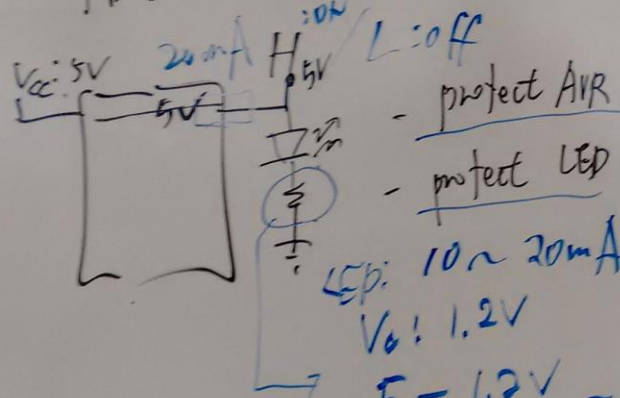

PORT.

PIN.

DDR : Names of register.

GPDD: General Purpose Digital Output: LED light ON/OFF.

PB0 → LED Connect and light ON/OFF by Sending Logic H or L.

$$\frac{5 - 1.2V}{10mA} = R$$

$$I_{PB0} = \frac{3.2V}{10mA} = 320A$$

$$\frac{3.2V \times 10^3}{10 \times 10^3} = 320A$$

## How to Study ECE 3411

6	4	2	1	8	4
0	0	1	0	0	0

PB1=H

- ① Basic understanding: Logic gate, bit computation. Circuits → connect
- ② programming practice
  - C programming: basic C programming
  - \* Datasheet: download from web
- ③ Hardware configuration
  - Text book: C programming AVR.
  - Lab guideline.
- ④ Lab practice.
- ⑤ Lab test
  - Selective topics: 1 ~ 10, extra 2
  - combined lab practice and additional complexity

$\begin{matrix} 8 & 4 & 2 & 1 \\ \hline 0 & 0 & 1 & 0 \end{matrix}$ 
PORB = 0x22;

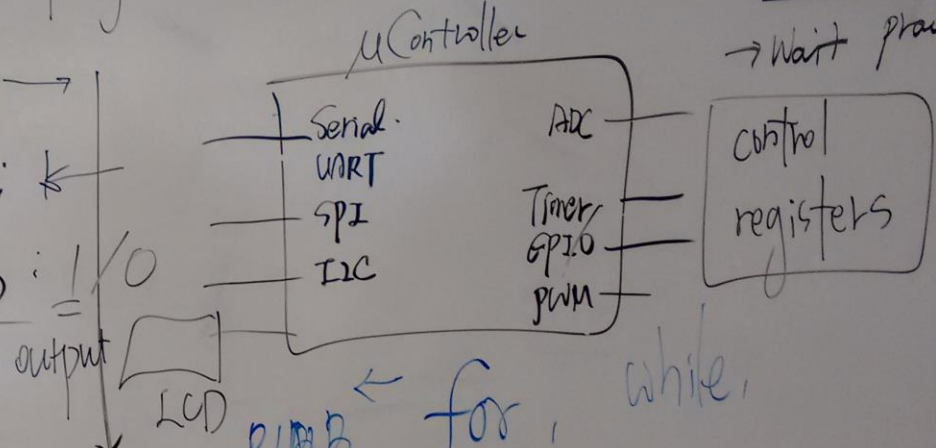

$PB1 = H$     $PB0 = L$

connections, selection of parts, → follow step-by-step guideline. → Xplained bd explore. → Need to order. → wait pract.

programming reference.  
 from website.

AVR peripheral.

H/w explanation  
GPIO: PORTB →  
 PIN B: ←  
DIRB: 1/0

2 complexity : demonstrate your understanding & performance

$\overline{PINB}$  ← for, while,  
 $ReadB = \overline{PINB} \text{ case}$
